Art Unit: 2125

DETAILED ACTION

Allowable Subject Matter

- 1. Claim 11 is allowed
- 2. Claim 4-8 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
- Claims 12-15 and 19 would be allowable if rewritten to overcome the rejection(s) under 35 U.S.C. 112, second paragraph, set forth in this Office action and to include all of the limitations of the base claim and any intervening claims.

Claim Rejections - 35 USC § 112

- 4. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 5. Claims 12-15 and 17-19 recites the limitation "system". There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes

Art Unit: 2125

of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

7. Claim 1-3, 9-10, and 16-18 rejected under 35 U.S.C. 102(e) as being anticipated by DeWitt et al. U.S Pub. No. 2003/0014376.

Regarding claim 1, DeWitt et al. disclose a method of processing material, comprising: placing the material onto a milling line for processing(see page 1, para[0003] lines 3-5); initializing a sensor positioned to sense a measurement of a predetermined characteristic of a predetermined portion of the material, the sensor protected by a sensor housing(see page 2, para[0029] lines 6-8);

initializing a stepper motor, disposed proximate the line, to a predetermined position(see page 2, para[0027] lines 1-3);

processing the material at a predetermined location along the milling line(see page 2, para[0027] lines 3-4);

sensing a predetermined characteristic of the material on the milling line(see page 2, para[0029] line 2),

calculating an adjustment of the material in a predetermined plane using the sensed characteristic(see page 2, para[0022] lines 1-4);

sending a signal to the stepper motor based on the calculated adjustment, if the adjustment is non-zero(see page 2, para[0027]);

and retaining the sensed characteristic of the material for certification of the sensed characteristic(see page 2, para[0022] lines 15-16).

Art Unit: 2125

Regarding claim 2, DeWitt et al. further discloses the method further comprises sensing a predetermined characteristic of the material on the milling line by physical contact of the sensor with the material to be processed(see page 2, para[0029] line 3).

Regarding claim 3, DeWitt et al. further discloses the method wherein the sensed characteristic comprises a measurement of a predetermined portion of the material in a single-plane(see page 2, para[0029] lines 4-6).

Regarding claim 9, DeWitt et al. further discloses the method wherein the material is at least one of metal, plastic, glass, paper(mail), organic materials, and composites is inherent to DeWitt et al.

Regarding claim 10, DeWitt et al. further discloses the method wherein the processing is at least one of cutting, shaping, etching, assembling, welding, progressive dies, stamping, and riveting(see abstract line 8).

Regarding claim 16, DeWitt et al. further discloses a device for processing a material, comprising:

a milling table for movably accepting material to be processed(see Fig 1);

a plurality of stepper motors operatively connected to the milling table, at least one first stepper motor being capable of moving the material in a first plane(see page2, para[0027] and para[0033] lines 7-12);

and of interneon. Toro

the sensed measurements(see page 2, para[0022]).

Art Unit: 2125

a materials processor(see page 1, para[0003] lines 3-5);

a measurement sensor situated within a sensor housing(see page 2, para[0029] lines 6-8);

a controller operatively connected to the measurement sensor and the plurality of stepper motors

(see page 2, para[0027]);

and a computer operatively in communication with the controller, wherein the computer calculates an adjustment of the material on the milling table using a sensed measurement; the computer provides the controller with data useful in controlling at least one of the stepper motors based on the calculated adjustment; and the computer concurrently generates a certification of

Regarding claim 17, DeWitt et al. further discloses the system further comprising a tensioner connected to at least one of the plurality of stepper motors for maintaining a predetermined pressure between the stepper motor and the material(see page 2, para[0033] lines5-6).

Regarding claim 18, DeWitt et al. further discloses the system wherein the measurement sensor is at least partially in physical contact with the material to be processed(see page 2, para[0029] line 3).

Art Unit: 2125

Response to Arguments

Applicant's arguments filed 3/5/04 have been fully considered. It should be noted that the milling line/table in claims 1 and 16 are being interpreted as a common conveyor since there is no machining/milling realized. Claims 1 and 16 are basically oriented towards movement/sensing of material.

Citation of Pertinent Prior Art

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The following patents are cited to further show the state of the art with respect to system and method for manufacturing a material using concurrent dimension certification:

a. U.S. Pat. No. 5,660,262 to Landrum et al., which discloses high speed carton feeding/turning system.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Carlos Ortiz-Rodriguez whose telephone number is (703) 305-8009. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Leo P. Picard can be reached on (703) 308-0538. The central official fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-3900.
